## Цель работы:

Изучение биллинговой системы и тарификации звонков.

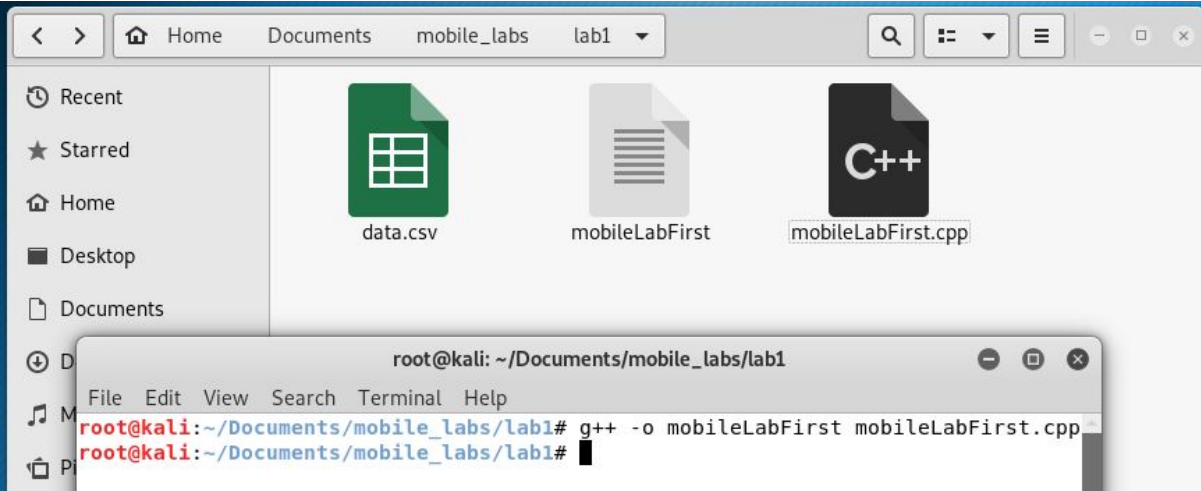

## Задачи:

Реализация простейшего правила тарификации для услуг типа “Телефония” по длительности разговора и “СМС” по общему количеству.

## Реализация

Программа была реализована на языке C++ из-за достаточных знаний этого языка для выполнения данной работы.

## Выполнение программы

The screenshot shows a file manager window with the path `Home > Documents > mobile_labs > lab1`. It contains three files: `data.csv` (green icon), `mobileLabFirst` (white icon), and `mobileLabFirst.cpp` (black icon with C++ logo). Below the file manager is a terminal window titled `root@kali: ~/Documents/mobile_labs/lab1`. The terminal shows the following commands and output:

```
root@kali:~/Documents/mobile_labs/lab1# g++ -o mobileLabFirst mobileLabFirst.cpp
root@kali:~/Documents/mobile_labs/lab1#
```

Below the terminal window, the execution of the program is shown:

```
root@kali:~/Documents/mobile_labs/lab1# g++ -o mobileLabFirst mobileLabFirst.cpp
root@kali:~/Documents/mobile_labs/lab1# ./mobileLabFirst
Manual entry? If not, variant 10 (Y/N)
N
Total price = 229.44 rubles
root@kali:~/Documents/mobile_labs/lab1#
```

```
root@kali:~/Documents/mobile_labs/lab1# ./mobileLabFirst
Manual entry? If not, variant 10 (Y/N)
Y
Phone Number = 933156729
Price for outgoing calls change in: 0.5
Price before the timer: 4
Price after the timer: 2
Price for incoming calls change in: 0.5
Price before the timer: 4
Price after the timer: 2
Price for SMS change after: 0
Price: 1.5
Total price = 462.32 rubles
root@kali:~/Documents/mobile_labs/lab1#
```

## Выводы

Во время выполнения данной лабораторной работы, были реализованы простейшие правила тарификации.

## Исходный код

Исходный код можно найти на

[https://github.com/larentoun/ITMO\\_Mobiles\\_N3350\\_NakhodkinAM](https://github.com/larentoun/ITMO_Mobiles_N3350_NakhodkinAM)

Исходный код:

```
#include <iostream>
#include <string>
#include <sstream>
#include <fstream>
#include <vector>
```

```
using namespace std;
```

```
float read_data(string phoneNumber, int callReceivePriceA, int
callReceivePriceB, float callReceivePriceTimer, int callPriceA, int callPriceB,
float callPriceTimer, int smsPriceA, int smsPriceB, int smsPriceCounter)
{
    float totalPrice = 0;

    //open file
    fstream fileToRead;
```

```

fileToRead.open("data.csv", ios::in);

//create a vector which will be written
vector<string> row(5);
string line, word, temp;

//reading every row and comparing it to the request
while (fileToRead >> temp)
{
    row.clear();

    getline(fileToRead, line);
    stringstream s(line);

    // read every column data of a row and
    // store it in a string variable, 'word'
    while (getline(s, word, ','))
    {
        row.push_back(word);
    }

    //row[0] = timestamp
    //row[1] = caller
    //row[2] = receiver
    //row[3] = call duration
    //row[4] = nummber of SMS

    //Change totalPrice if needed
    if (row[1] == phoneNumber)
    {
        if (stof(row[3]) > callPriceTimer)
